ONLINE-WEBINAR

Digital dentistry has embraced 3D printing in leaps and bounds in recent years. Recent improvements in technology and software have meant it is not only easy, but also cost-effective to introduce 3D printing into dental practice.

Dental implantology is no different. In this webinar, we will explore what 3D printers are available in the dental market, what to consider when investing into a 3D printing system, and how 3D printing has advanced the placement and restoration of implants. We will also discuss how innovative implant design and digital technology have opened up new potential applications in traditional implant treatment and workflows.

LEARNING OBJECTIVES:

- ✘ Different 3D printers available in the market and what to consider when investing into a 3D printing system
- ✘ How innovative implant design synergises with dental 3D printing
- ✘ How 3D printing can unlock new applications in dental implantology and how they can benefit our patients
